

Benefits of **ALERT**:

For Emergency Department

- Real-time information is displayed in the ED/hospital EMR.
- Better care as information from the ambulance is provided to ED while patient is en route so the ED can be prepared for complex patients -- STEMI, stroke, massive trauma.
- Preadmission of the patient allows ED physicians to place orders before patient arrives, especially important for STEMI, stroke and massive trauma.
- Reduced data entry in the ED.
- Cost reduction due to decreased manual processes.

For Paramedics

- Less reliance on informal verbal communication.
- No more photos of EKGs sent to ED, as actual EKGs are provided.
